                                                          This sequence represents a fragment of the human connective tissue growth factor (CTGE) Polypeptide which has mitogenic activity. The growth factor (CTGE) Polypeptide which has mitogenic activity. The sequence covers the amino acids encoded by exons 4 and 5 of the full sequence covers the amino acids encoded by exons 4 and 5 of the full length cDNA sequence (AAA11280). The protein can be used to raise antibodies which specifically bind to CTGE and are used to rise antibodies which specifically bind to CTGE and are used to treat a antibodies which associated dispass of disorder, e.g. a fibroproliferative fibrosis, such as kidney fibrosis, scheroderm, pulmonary fibrosis, liver fibrosis, arthritis, hypertropic scarring, atherosclerosis, diabetic nephropathy and retinopathy, hypertension, kidney disorders, and cardiovascular disorders. The protein is also useful in wound healing, bone and tissue repair.
                                                                                                                                                                                                                                                                                                            Gaps

Recombinant CTGF can be produced in prokaryotic or eukaryotic host secombinant CTGF can be produced in prokaryotic or eukaryotic host cells utilising an isolated CTGF gene (AAT59618). Compsis.

cells utilising an isolated CTGF gene (AAT59618). Compsis.

induce bonding formation, e.g. to treat osteopporesis, induce bonding formation, e.g. to treat osteopporesis, contacton, and to induce wound healing. It can also be used in formation, and to induce wound healing. It can also be used in culture systems e.g. to expand stem cells or chondrocytes prior to re-implantation. CTGF is more stable to protease degradation than other growth factors used as prior art wound healing agents.

                                                          Novel human connective tissue growth factor (CTGF) (AAR79964) is related immunologically and biologically to platelet-derived growth factor (PDGF), but is the product of a distinct gene.

GTGF is mitogenic and ano fibroblastic capat for cells. It is produced by endothelial and fibroblastic cells, and probably acts as a growth factor in wound healing. Recombinant CTGF can be obtd. by expression of CDNA clone DBG0R32 (AAT04226) in transformed host cells. It is used to accelerate wound healing, and to raise antibodies useful in detecting disorders associated with overgrowth of cells, such as cancer, fibrotic diseases and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Connective tissue growth factor; CTGF; mitogen; cell proliferation; wound healing; cancer; tumour; fibrosis; glaucoma; atherosclerosis; scleroderma; arthritis, cirrhosis; scar; diagnosis; therapy.

                                                                                                                                                                Novel human connective tissue growth factor (CTGF) (AAW09089) is a PDGF-immunorelated protein that may play a significant role in the normal development, growth and repair of human tissue and probably functions as a growth factor in wound healing. CTGF may be involved in diseases in which there is an overgrowth of connective tissue cells, such as cancer, tumour formation and growth, fibrotic diseases (e.g. pulmonary fibrosis, kidney fibrosis, glaucoma) and atherosclerosis. Recombinant CTGF can be produced in transformed host cells utilising a cDWA clone isolated from a HUVEC library. It can be used to accelerate wound healing. CTGF inhibitors can be used to treat atherosclerosis and fibrotic diseases such as scleroderma, arthritis, liver cirrhosis, and scarring.

A method has been developed for ameliorating a cell proliferative disorder associated with connective tissue growth factor (CTGF). The disorder associated with connective tissue growth factor (CTGF). The binds to CTGF and not to platelet-derived growth factor (PDGF), to the bits of the disorder. CTGF is related immunologically and biologically site of the disorder. GTGF is related immunologically and biologically to PDGF. The present sequence represents CTGF. The method is used to treat conditions involving the overgrowth of connective tissue cells such as cancer, atherosclerosis and other fibrotic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 RPCEADLEENIKKGKKCIRTPKISKPIKFELSGCTSMKTYRAKFCGVCTDGRCCTPHRTT 120

                                                                                                                                                                                                                                This sequence represents the human connective tissue growth factor (CTGF): CTGF is related immunologically and biologically to cape of careford growth factor (PDGF), but is encoded by an unrelated platelet-derived growth factor (PDGF), but is encoded by an unrelated cape of evelopment, growth, and repair of human tissue, similarly to PDGF. The development, growth, and repair of human tissue, similarly to PDGF. The CDMA encoding this sequence was isolated by screening a CDNA library from CDMA encoding this sequence was isolated by screening a CDNA library from CDMA encoding this sequence would healing. Also, elevated levels of CTGF may be diagnostic of proliferative diseases involving outgrowth of CTGF may be diagnostic of proliferative diseases and enterosclerosis. All of these diseases can be treated with reagents cactive with CTGF, such as antibodies (which can also serve as assay reactive with CTGF such as antibodies (which can also serve as assay captable, and less susceptible to protease degradation than PDGF, and conter growth factors involved in wound healing.                                                                                                                                                                                                     ö
                                                                                 This sequence is the human connective tissue growth factor (CTGF). The invention relates to a method of detecting a cell proliferative disorder comprising comparing the level of CTGF in a sample against a control, where an increase is indicative of a cell proliferative disorder (fibrotic disease or atherosclerosis). The method is used to detect cell proliferative disorders such as fibrotic disease and atherosclerosis.

```
factor (CTGF). This can be used in the method of the invention for inducing bone or tissue formation that comprises administration to a patient, a composition comprising CTGF and a carrier. CTGF can also be used in a method for inducing wound healing. The methods can be used for inducing bone, tissue or cartilage formation in disorders such as osteoporosis, osteoarthritis or osteochondrytis, arthritis, skeletal disorders, hypertrophy, or in wound healing. The CTGF and functional fragments are more stable and less susceptible to protease degradation than platelet derived growth factor (PDGF) and other growth factors known to be involved in wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240 rpceadleenikkgkkcirtpkiskpikfelsgctsmktyrakfcgvctdgrcctphrtt 299

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a human connective tissue growth factor (CTGF) polypeptide which has mitogenic activity. The protein can be used to raise antibodies which specifically bind to CTGF and are used to treat a cTGF-associated disease or disorder, e.g. a fibroproliferative disease/disorder such as kidney fibrosis, scleroderma, pulmonary fibrosis, liver fibrosis, arthritis, hypertropic scarring, atherosclerosis, diabetic nephropathy and retinopathy, hypertension, kidney disorders, and cardiovascular disorders. The protein is also useful in wound healing, bone and tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 RPCEADLEENIKKGKKCIRTPKISKPIKFELSGCTSMKTYRAKFCGVCTDGRCCTPHRTT 120

                                                                                                                                                                         The present sequence is human connective tissue growth factor, which is a member of CCN growth regulator family. It has antiangiogenic activity and is a potent inhibitor of basic fibroblast growth factor (bFGF)-stimulated bovine endothelial cell proliferation. It contains insulin-like growth factor (IGF)-binding domain, von Willebrand factor type C repeat, Thrombospondin type I domain and C-terminal cysteine knot profile (CTCK)-2 domain. It can be used to treat conditions associated with abnormal angiogenesis or neovascularisation like, retinal neovascularisation, tumour growth, haemangioma, solid tumours, leukaemia, metastasis, psoriasis, neovascular glaucoma, diabetic retinopathy, arthritis, endometriosis and premature retinopathy.

CTGF is a mitogen and chemotactic agent for connective tissue cells and plays a significant role in normal development, growth and repair of human tissues. It is useful as a therapeutic for accelerating wound healing and promoting normal healing mechanisms and may therefore be used in the treatment of 6 e.g., burns. CTGF is also useful as a diagnostic reagent for diagnosing pathological states in a patient suspected of having a disease characterised by a busing an acceleration. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                Producing connective tissue growth factor involves transforming a host cell with polynucleotide encoding the growth factor and growing the cell under optimum conditions so that the polynucleotide is expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 RPCEADLEENIKKGKKCIRTPKISKPIKFELSGCTSMKTYRAKFCGVCTDGRCCTPHRTT 120

The invention relates to methods of accelerating wound healing in a patient. One method involves contacting the site of the wound with a patient. One method involves contacting the site of the wound with a composition comprising promise tissue growth factor composition comprising prowing growth factor beta (TGF-beta), which (TGF AAB48813) and transforming growth factor beta (TGF-beta), which still a the production of CTGF in vivo. Another method involves still a the growth of connective tissue cells by contacting the growth of connective thereof. CTGF is produced by cells with CTGF or an active fragment thereof. CTGF is produced by cells it has biologically similar activity to PDGF (platelet-derived site of a wound, and is also immunologically related to it, but it is growth factor), and is also immunologically related to it, but it is growth factor) and is also immunologically size tissue cells. CTGF, or healing by stimulating the growth of connective tissue cells. CTGF, or is functional fragments, is more stable and less susceptible to involved in wound healing. The present sequence represents human CTGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 RPCEADLEENIKKGKKCIRTPKISKPIKFELSGCTSMKTYRAKFCGVCTDGRCCTPHRTT 120

connective tissue growth factor (GTGF). AAY24369 to AAY24378 represent connective tissue growth factor (GTGF). AAY24369 to AAY24378 represent these monoclonal antibodies. The antibodies are useful in the diagnosis, prevention and treatment of cell proliferation disorders in which GTGF is implicated, including fibrosis of lung, kidney, liver and other tissues; liver cirrhosis; nephritis; skin ulcers and keloid; rheumatoid arthritis; rheumatic vascular inflammation; hepatitis; and cancer. The present sequence represents rat GTGF.
                                                                                                                                                                                                                                                                         AAX90020 to AAX90029 encode monoclonal antibodies which react with human

Screening actuation sequence with two probes from untreated with TGF-betal and cyclohexamide with two probes from untreated AKR-2B mouse cells induced with TGF-betal and cyclohexamide with two probes from untreated AKR-2B mRNA and AKR-2B mRNA from cells treated with cyclohexamide and TGF-betal.

Detal. The proteins encoded by hybridising colonies (beta-IG-M1 and beta-IG-M2) contain 38 Cys residues and are induced by TGF-betal.

Deta-IG-M2 included by various from the GCGCXXC motif reported in the manno half of insulan-like growth factor (IGF) binding proteins.

The C-terminal Cys rich region of beta-IG-M1, -M2 and CEF-10 contain an amino acid sequence with strong homology to a motif found near the C-terminal of the malarial circumsporozoite (CS) protein, which is criminal circumsporozoite (CS) protein, which is chighly conserved among all species of malarial parasites sequenced to date (designated region II). This motif is also found in other proteins which have cell addressive properties that mediate cell-cell and cell-extracellular matrix interactions, such as properdin, thrombospondin, and TRAP. The proteins encoded by TGF-beta induced genes are likely to be involved in mediation of the biological effects of TGF-beta relating to cell growth and differentiation. See also AAR25565.
